In regards to #98N-10, it should be known that the approval of the aforementioned will be to the detriment of the American people. With escalating cancer rates and the biological phenomenon of lower sperm counts, all of which are proven to stem from exposure to radioactive substances, it seems foolish, if not utterly reckless to allow the large scale implementation of "electronically pasturizing" to substances that we ingest.

Since the FDA is already aware of the American people's disapproval (nearly %70 of all those polled) of such methods of radiating food goods, I can formulate no explanations why such an allowance would even be considered by an entity of a democratic government other than pressure from organized farm/large food interests. I hope, if this is the case, that the best interest of the American people will be pursued rather than succumbing to the wants of big money. Please refuse to grant implementation of #98N-10.
Thank You,

Matthew B. Miller
